Your Maths teacher assigns you a homework

But you as a mischievous always copy it from your friend

So you have 2 jobs to be done

- do_homework
- copy_homework

So you write the following code to accomplish this

```
function do_homework( ){  
    //doing math  
}  
  
function copy_homework( ){  
    //copying homework  
}  
  
do_homework();  
copy_homework();
```

Even though `do_homework` is called before `copy_homework`, you don't know how long will it take for your friend to complete the homework and `copy_homework` will be called immediately of no use

```
do_homework();  
copy_homework();
```

hmm.. But I haven't
completed it yet .

You don't want to copy empty homework

You want to wait until `do_homework` is done and only then call `copy_homework`

This is where **callbacks** come into play

A callback is a function passed into another function as an **argument** to be executed later.

eg

```
function do_homework(callback){  
  //doing math  
  callback();  
}
```

executes only after
doing math is completed

```
function copy_homework( ){  
  //copying homework  
}
```

```
do_homework(copy_homework);
```

function passed

```
do_homework(copy_homework);
```

Now `copy_homework` is only called once `do_homework` is done
